

Lab 04: Student Course Registration API using Express.js and MongoDB

Web Application Development

- The Department of Computer Science requires a backend application to manage student course registrations.
- Develop a REST API that allows administrators to add, retrieve, and delete student registration records.
- Only the backend implementation is required.

Each registration should contain the following information.

Field	Data Type
REGISTRATION_ID	Number
STUDENT_NAME	String
STUDENT_EMAIL	String
COURSE_CODE	String
COURSE_NAME	String
SEMESTER	String
YEAR	Number
CREDITS	Number

StudentRegistrationAPI/

```
|
|— models/
|   Registration.js
|
|— routes/
|   api.js
|
|— server.js
|— package.json
|— README.md
```

1. Create a Database UniversityDB

2. Create a Student model (Registration.js). The model should contain all the fields given in the table above.

3. Create the following API endpoints (student-api.js)

POST	student/save	Insert one hard-coded student into MongoDB.
POST	student/saveStudent	Accept student details through the request body and store them
GET	student/findAllStudent	Return all students records
GET	student/findFirstStudent	Return only the first student details.
DELETE	/student/delete/:id	Delete the student using the ID.
POST	/student/delete	Accept the MongoDB _id via request body and delete

4. Configure the server (server.js)

- Connect to MongoDB.
- Parse JSON request bodies.
- Register the API routes.
- Listen on port **3000**.
